Evidence-Based movement is growing.

- “The golden age of evidence-based policy” (Haskins 2017).
- Credible causal evidence (Angrist & Pischke, 2010)
- Transparency and reproducibility of research (Miguel et al. 2014).
- Commission on Evidence-Based Policymaking (CEBP, 2017)

Policy Analysis is a fundamental link.

- As many definitions as textbooks (Dunn, 2015; Weimer & Vining, 2017; Williams, 1971)
- Common denominator: client-oriented empirical analysis meant to inform a specific policy debate
- Aspires at scientific rigor. (Wildavsky 1979),

Crisis in Research

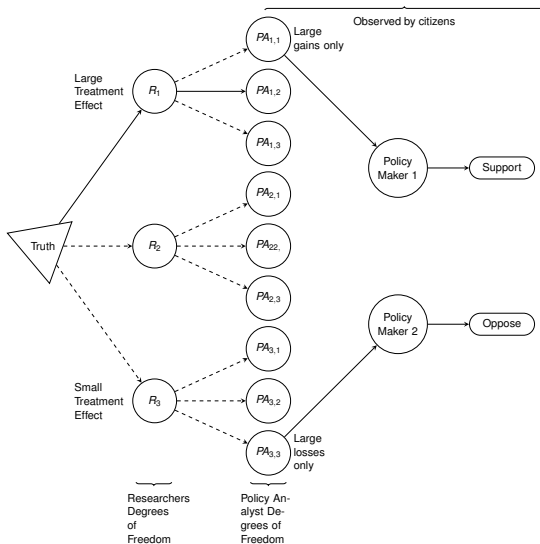

Open Science

Crisis in PA

Open PA

Suggestions

Conclusion

Main consequences of policy analysis that lacks openness:

- 1 Cherry picking evidence.
- 2 Challenging to automate and Improve systematically recurring reports.
- 3 Difficulty understanding how research informs policy analysis.

Cherry Picking Evidence

Open PA

Conclusion

“When I was director of the CBO, I was very frustrated when we would write a policy report [saying] a certain policy would have these two advantages and these two disadvantages, and the advocates would quote only the part about the advantages, and the opponents would quote only the part about the disadvantages. That encourages the view that there are simple answers. There aren’t generally simple answers. There are trade-offs.”

— Douglas Elmendorf (Director of CBO, 2009-2015)
Harvard Magazine, 2016

1 Policy Analysts: Just Post It.

Things are moving in this direction. Play a leading role in a credibility revolution for policy analysis.

2 Policy Analysis Organizations: Open by Default

1 Policy Analysts: Just Post It.

Things are moving in this direction. Play a leading role in a credibility revolution for policy analysis.

2 Policy Analysis Organizations: Open by Default

Boost in credibility, lower costs in the long run.
Examples: GiveWell, and AEI.

3 Government Agencies and Funders: Support Open Policy Analysis

Examples: Require contracted policy

Policy Analysis Examples: Require contracted policy analysis to be fully open. Support training and adoption of new tools (VC and DD). Inject resources for the transition.

Sensitivity Analysis For Multiple Parameters

Table: $\% \Delta W$ for a $\% \Delta$ in inputs. Two sample policy makers.

		Re-distributional Preferences			
		Dislikes ($\rho = -0.1$)		Likes ($\rho = 0.1$)	
Source	Input	$10\% \Delta^+$	$10\% \Delta^-$	$10\% \Delta^+$	$10\% \Delta^-$
Data					
	Annual wage growth (g_w)	-3%	2%	-2%	1%
	Annual growth in N	0.8%	-0.9%	0.5%	-0.5%
Research					
	η_{teen}	-4%	4%	-2%	2%
	Ripple Scope (8.7, 11.5)	37%	-24%	21%	-14%
	Ripple Intensity ($50\% \Delta w$)	5%	-5%	3%	-3%
Guess Work					
	Extrapolation factor (F_{ex})	-3%	2%	-1%	1%
	Non compliance (α_1)	-7%	7%	-4%	4%
	Substitution factor (F_{sub})		20%		-8%
	Net benefits	-5%	5%	2%	-2%
	Distribution of balance losses				
	Current: (1%, 29%, 70%)				
	(1%, 4%, 95%)	22%		13%	
	(5%, 35%, 60%)	-17%		-9%	
	$1/N$	-129%		-73%	

- There is additional scope for reproducibility.
- Complete case study requires extensive institutional knowledge.
- Guidelines need to be build based on consensus of practitioners.

- Costs of producing the next report on effects of minimum wage will be very small.
- Every additional effort will imply improvements on the “state of the art” report (e. g. $dB L$; $\eta(MW)$, $\alpha_1(MW)$)
- Learning about one parameter (QALYs, DWL) will update estimates *across* reports.
- Much easier to have a substantive and normative policy debate. Pilot example: [Shiny App!](#).

Possibilities for Collaboration

OPA - Minimum Wage

Motivation

Case Study

Guidelines

Application

Sensitivity
Analysis

Discussion

- CBO is a leader in policy analysis. Leading OPA would shield its credibility and encourage others (ala Journal Science for Empirical Research).
- What can BITSS offer:
 - Technical support next case study (funded through August 2018).
 - Training on research transparency methods.
- Join a group of experts to develop and publish guidelines (APPAM 2018 convening).

OPA -
Minimum
Wage

Employment
Wages
Income

Steps taken to verify the analysis & employment variation
($\widehat{\Delta E} \times 1000$) at each line¹

1 Find an elasticity: -0.1 (page 25): $\widehat{\Delta E} \approx 300$

2 What about adults? $\eta^{adults} = \frac{1}{3}\eta^{teens}$ (page 28):
 $\widehat{\Delta E} \approx 100$

3 What about the adjustment? $\eta_{w \leq MW}^g = \frac{\eta_{in}^g}{P_{w \leq MW}^g} \times \frac{\% \Delta MW}{\% \Delta w^g}$
(page 26-28 + 2 papers): $\widehat{\Delta E} \approx 1,100$

4 The adjustment factors $\frac{1}{P_{w \leq MW}^g} \times \frac{\% \Delta MW}{\% \Delta w^g} = F_{adj}^g$ are not
computed from the data (3.2 teens, 19.5 adults).
Instead: $F_{adj}^{teen} = F_{adj}^{adult} = 4.5$ (page 28) $\widehat{\Delta E} \approx 500$

Steps 2-4 took several days of work! •

¹ Assuming target population ≈ 22 million, $\overline{\Delta w_{w \leq MW'}}$ $\approx 14\%$, and
non-compliance $\approx 15\%$

Easier Methodological Appraisal. Example: dis-employment effects **Before**

Reader Companion for CBO report on Min Wage (Preliminary Version. Do Not Circulate)

Fernando Hoces de la Guardia + (hopefully) a lot more people

Last edit: 2016-10-16

1 Introduction

The role of policy analysis is to connect research with policy. Because of heavy time constraints, policy analyses are typically ambiguous regarding the details of how the analysis was carried out. This creates three problems: (i) its hard to understand the connection between research and policy, (ii) allows policy makers to cherry pick policy reports, and (iii) hinders systematic improvement and/or automation of parts of the analysis. In this document we demonstrate the use of a reproducible workflow to reduce the ambiguity in policy analysis.

Here we attempt to contribute to the policy discussion of the minimum wage. The minimum wage is a contentious policy issue in the US. Increasing it has positive and negative effects that different policymakers value differently. We aim to add clarity on what those effects are, how much do we know about them, and how those effects vary when elements of the analysis change. We select the most up-to-date, non-partisan, policy analysis of the effects of raising the minimum wage, and build an open-source reproducible analysis on top of it.

In 2014 the Congressional Budget Office published the report titled "[The Effects of a Minimum-Wage Increase on Employment and Family Income](#)". The report receive wide attention from key stakeholders and has been used extensibile as an input in the debate around the minimum wage¹. To this date we consider the CBO report to be the best non-partisan estimation of the effects of raising the minimum wage at the federal level. Although there was disagreement among experts around some technical issues, this disagreement has been mainly circumscribed around one of the many inputs used in the analysis, and we can fit the opposing positions in to our framework.

Our purposes are twofold: First, promote the technical discussion around a recurrent policy issue (minimum wage) by making explicit and visible all the components and key assumptions of its most up-to-date official policy analysis. Second, demonstrate how new scientific practices of transparency and reproducibility (T & R) can be applied to policy analysis. We encourage the reader to collaborate in this document and help develop an ever-improving version of the important policy estimates² (re)produced here.

2 Employment effects

At a general level the effects on employment ($\widehat{\Delta E}$) will be calculated using a more detailed version of the following equation:

$$\widehat{\Delta E} = N \times \eta \times \% \Delta w + \text{Other factors}$$

Where N represents the relevant population, η the elasticity of labor demand, Δw the relevant percentual variation in wages, and the *Other factors* will encapsulate effects on employment through an increase in the aggregate demand.

To describe the methodology behind each of those four components we first describe the data used, the wage variable choose, and the procedure used to forecast the wage and population distribution of 2016 using data from 2013.

2.1 Data, wages, and forecast

To simulate the policy effects we need the distribution of wages and employment under the status quo. From the perspective of 2013, this implies forecasting to 2016 data on employment and wages.

2.1.1 Data

The Current Population Survey (CPS) was used to compute the effects on employment. From the analysis in the section on distributional effects we can deduce that the data corresponds to the Outgoing Rotation Group (ORG). CPS is a monthly cross sectional survey. The same individual is interviewed eight times over a period of 12 months. The interviews take place in the first and last 4 months of that period. By the 4th and 12th interview, individuals are asked detailed information on earnings. The CPS ORG file contains the information on this interviews for a given year. We analyze the data for 2013.

Currently three versions of these data sets can be found online: [CPS raw files](#), [ORG NBER](#) and [ORG CEPR](#). The analysis will be performed using the CPER ORG data base.

The weights used in our analysis will be `orgwgt/12`

2.1.1.1 Code to load the data

```
R  
Stata
```

2.1.1.1 Code to load the data

```
R  
call.cps.org.data <- function(){  
  data_use <- "CPER_ORG"  
  
  # Using CPER ORG data  
  if (data_use == "CPER_ORG") {  
    # Checking if working directory contains data, download if not.  
    if ( !("cepr_org_2013.dta" %in% dir()) ) {  
      # create name of file to store data  
      tf <- "cepr_org_2013.zip"  
  
      # download the CPS repwgt's zipped file to the local computer  
      download.file(url = "http://ceprdata.org/wp-content/cps/data/cepr_org_2013.zip", tf, mode  
= "wb" )  
  
      # unzip the file's contents and store the file name within the temporary directory  
      fn <- unzip( zipfile = tf, overwrite = T )  
    }  
    df <- read.dta("cepr_org_2013.dta")  
  }  
  
  # Using NBER ORG data  
  if (data_use == "NBER_ORG") {  
    # Checking if working directory contains data, download if not.  
    if ( !("morg13.dta" %in% dir()) ) {  
      # Downloading data 53mb  
      df <- read.dta("http://www.nber.org/morg/annual/morg13.dta")  
    }  
    df <- read.dta("morg13.dta")  
  }  
}
```

2.5 Computing effects on employment

Putting all elements together we get:

$$\widehat{\Delta E} = \sum_{g \in \{A, T\}} \left(\widehat{N_g^{total}} \times \widehat{\eta_{w \leq MW}^g} \times \widehat{\% \Delta W^g} \right) - \widehat{OF}$$

2.5.1 Code to compute each component

R

Stata

Components of Elasticities

	Adult	Teen
η_{lit}	-0.03	-0.10
$\eta_{w \leq MW'}$	-0.23	-0.13
F_{adj}	4.50	4.50
$\% \Delta W$	13.81	16.65
$\widehat{\eta_{w \leq MW}}$	-0.15	-0.45

Using all the components described above we get $\widehat{\Delta^{-} E} = -478$ thousand jobs. The report however computes F_{adj}^g in a different fashion and gets a value of 4.5 (when computing the values of F_{adj}^g from the table below - as oppose to using historical values - we get $\widehat{\Delta^{-} E} = -321$ thousand jobs).

3 Distributional effects

In the first step towards obtaining the policy estimates presented in the [introduction](#) we concluded with
