### **Approach**

OPA -Minimum Wage

Motivatio

Approach

Case Stud

Guideline

Sensitivity Analysis

Analysis Discussior

- Identify a case study
- Define guidelines
- Demonstrate how to achieve highest standards of OPA
- Use sensitivity analysis to explore biggest policy unknowns
  - Surprisingly academic debate around one specific parameter seems less relevant from policy perspective

#### Description of Case study

OPA -Minimum Wage

Motivation Approach

Case Study
Guidelines

Sensitivity Analysis "The Effects of a Minimum-Wage Increase on Employment and Family Income" Congressional Budget Office (2014)

**Description:** CBO estimated the effects of a raise in the federal minimum wage from \$7.25/hr to \$10.10/hr.

#### Main policy estimates:

- 500,000 jobs would be lost.
- 16.5 million workers would receive a salary increase.
- Distributional effects: below poverty line (PL) +\$5billion; between one and three PL +\$12billion; between three and six PL +\$2billion; above six PL -\$17billion

**Key research estimate:** Elasticity of labor demand for teenagers in the labor force.

#### Reasons for Selecting the Case Study

OPA -Minimum Wage

A .......

Case Study

Guidelines

Application Sensitivity

Diegueeig

Scalable: CBO's reputation: among the most transparent and rigorous policy analysis offices. Lessons from OPA that apply to CBO should apply also to most agencies. Additionally the policy issue is widely known which facilitates parallels.

Recurrent: This policy analysis will be conducted again in the future. The case study can be directly used in future calculations.

#### Reasons for Selecting the Case Study

OPA -Minimum Wage

Motivatio

Approach

Case Study

Guideline

Application

Sensitivity Analysis ■ Feasible: available data, good description of the analysis, and only one policy lever to analyze.

Case Study

Guidelines

Application Sensitivity

Analysis
Discussio

Model for the normative comparison made by a policy maker (welfare function):

$$\textit{W}(
ho) = \sum_{i \in \textit{N}} \left( \omega_{\textit{wg}} \textit{wg}_i + \omega_{\textit{wl}} \textit{wl}_i + \omega_{\textit{bl}} \textit{bl}_i \right) \omega_i^{\textit{d}}(\textit{Q}_i, 
ho)$$

with:

$$\omega_i^{\textit{d}}(\textit{Q}_i,\rho) = \frac{(1-\rho(\textit{Q}_i-\textit{Q}_{\textit{median}}))}{\sum_i \omega_i^{\textit{d}}(\textit{Q}_i)} \textit{Q}_{\textit{max}} \quad \text{for } \rho \in \left(-\frac{1}{2},\frac{1}{2}\right)$$

ho > 0 represent positive valuation of progressive redistribution. ho < 0 represents positive valuation of regressive redistribution (dis-utility from self loss greater than utility from others gain).

### Equations from Model in DD

OPA -Minimum Wage

Reference Employment Wages

$$\widehat{\Delta E} = N \times \eta \times \% \Delta w + \text{Other factors}$$
 (1)

$$\widehat{N_{\textit{final}}^s} = g_N(\hat{t}'|t) \times \hat{N_t^s} \times P(\hat{w'} \leq MW^{\textit{new}}|s) \times (1 - \hat{\alpha_1^s} - \hat{\alpha_2^s})$$
(2)

The elasticity for adults from the literature is define as the one for teenagers with an extrapolation factor.

$$\eta_{lit}^{adults} = \eta_{lit}^{teens} \times F_{extrapolation}$$
(3)

# Adjustments to the elasticity of labor demand

OPA -Minimum Wage

Reference Employment Wages Income Following Brown [1999,?]. First:

$$\eta_{lit}^s = p_{w \leq MW}^s \eta_{w \leq MW}^s + (1 - p_{w \leq MW}^s) \eta_{w > MW}^s$$
  $s = \{teens, add Second, assume  $\eta_{w \leq MW}^s = 0$ :$ 

$$\eta_{w \leq MW}^{s} = \frac{\eta_{lit}^{s}}{p_{w \leq MW}^{s}} \qquad s = \{teens, adults\}$$

And third, adjust for the effective average wage variation for each group  $(\sqrt[\infty]{\Delta w^s})$ :

$$\widetilde{\eta_{w \leq MW}^s} = \frac{\eta_{lit}^s}{p_{w \leq MW}^s} \times \frac{\%\Delta MW}{\sqrt[9]{6}\Delta w^s} = \eta_{lit}^s \times F_{adjs}^s$$
  $s = \{teens, adultities \}$ 

(4)

### Final Effect on Employment

OPA -Minimum Wage

Reference Employment Wages

$$\widehat{\Delta E} = \sum_{g \in \{A, T\}} \left( \widehat{N_g^{final}} \times \widehat{\eta_{W \leq MW}^g} \times \overline{\% \Delta w^g} \right) - \widehat{OF}$$
 (5)

### Effect on Wages

OPA -Minimum Wage

# Reader Companion for CBO report on Min Wage (Preliminary Version. Do Not Circulate)

Fernando Hoces de la Guardia + (hopefully) a lot more people Last edit: 2016-10-16

### 1 Introduction

The role of policy analysis is to connect research with policy, Because of heavy time constrains, policy analyses are typically ambiguous regarding the details of how the analysis was carried out. This creates three problems: (i) its hard to understand the connection between research and policy, (ii) allows policy makers to cherry pick policy reports, and (iii) hinders systematic improvement and/or automation of parts of the analysis. In this document we demonstrate the use of a reproducible workflow to reduce the ambiguity in policy analysis.

Here we attempt to contribute to the policy discussion of the minimum wage. The minimum wage is a contentious policy issue in the U.S. increasing it has positive and negative effects that different policymakers value differently. We aim to add clarity on what those effects are, how much do we know about them, and how those effects vary when elements of the analysis change. We select the most up-to-date, non-partisan, policy analysis of the effects of raising the minimum wage, and build an open-source reproducible analysis on top of it.

In 2014 the Congressional Budget Office published the report titled "The Effects of a Minimum-Wage Increase on Employment and Family Income". The report receive wide attention from key stakeholders and has been used extensible as an input in the debate around the minimum wage. To this date we consider the CBO report to be the best non-partisan estimation of the effects of raising the minimum wage at the federal level. Although there was disagreement among experts around some technical issues, this disagreement has been mainly circumscribed around one of the many inputs used in the analysis, and we can fit the opposing positions in to our framework.

Our purposes are twoflotf. First, promote the technical discussion around a recurrent policy issue (minimum wage) by making explicit and visible all the components and key assumptions of its most up-to-date official policy analysis. Second, demonstrate how new scientific practices of transparency and reproducibility (T & R) can be applied to policy analysis. We encourage the reader to collaborate in this document and help develop an ever-improving version of the important policy estimates? (related under the province of the province

### 2 Employment effects

At a general level the effects on employment  $(\widehat{\Delta E})$  will be calculated using a more detailed version of the following equation:

$$\widehat{\Delta E} = N \times n \times \% \Delta w + \text{Other factors}$$

Where N represents the relevant population,  $\eta$  the elasticity of labor demand,  $\Delta w$  the relevant percentual variation in wages, and the Other factors will encapsulate effects on employment through an increase in the aggregate demand.

To describe the methodology behind each of those four components we first describe the data used, the wage variable choose. and the procedure used to forecast the wage and population distribution of 2016 using data from 2013.

### 2.1 Data, wages, and forecast

To simulate the policy effects we need the distribution of wages and employment under the status quo. From the perspective of 2013, this implies forecasting to 2016 data on employment and wages.

#### 2.1.1 Data

The Current Population Survey (CPS) was used to compute the effects on employment. From the analysis in the section on distributional effects we can deduce that the data corresponds to the Outgoing Rotation Group (ORG), CPS is a monthly cross sectional survey. The same individual is interviewed eight times over a period of 12 months. The interviews take place in the first and last 4 months of that period. By the 4th and 12th interview, individuals are asked detailed information on earnings. The CPS ORG file contains the information on this interviews for a given year. We analyze the data for 2013.

Currently three versions of these data sets can be found online: CPS raw files, ORG NBER and ORG CEPR. The analysis will be performed using the CPER ORG data base.

The weights used in our analysis will be orgust/12

### g effects on

l effects g Family

policy effects g family itus quo and icrease siderations

### 2.5 Computing effects on employment

Putting all elements together we get:

$$\widehat{\Delta E} = \sum_{g \in [A,T]} \left( \widehat{N_g^{final}} \times \widehat{\eta_{w \leq MW}^g} \times \overline{\% \Delta w^g} \right) - \widehat{OF}$$

### 2.5.1 Code to compute each component

Stata

Components of Flasticitie

	Adult	Teer
$\eta_{lit}$	-0.03	-0.10
$\eta_{w \leq MW'}$	-0.23	-0.13
$F_{adj}$	4.50	4.50
<u>%∆w</u>	13.81	16.65
$\widetilde{\eta_{w \leq MW}}$	-0.15	-0.45

Using all the components described above we get  $\overline{\Delta} \cdot \overline{E} = -478$  thousand jobs. The report however compute  $F_{adji}^R$  in a different fashion and gets a value of 4.5 (when computing the values of  $F_{adji}^R$  from the table below - as oppose to using historical values - we get  $\overline{\Delta} \cdot \overline{E} = -321$  thousand jobs).

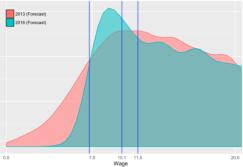

### 3 Distributional effects

In the first step towards obtaining the policy estimates presented in the introduction we concluded with
